Nail Trim-Complimentary

11-06-2023 11:16:28am, Dr. Kristin Foley

Canine Neuter

Specifics

Canine Castration

Pre-med Product:Buprenorphine 0.6 mg/ml

Administered when (time): 11:53am

Amount Administered: 1.0mls

Delivery:SQ

Delivery site:rump

Administered by:KF

Anesthesia

Induced with: 1.1 ml Midazolam and 1.1 ml Ketamine IV at 1:19pm

Intubated at (time): 1:21pm

Maintained on gas anesthesia (type):Isoflurane

Performed Intra-testicular Block with 4.0 mls Bupivacaine, 1.0 mls Lidocaine, and 0.1 mls Buprenorphine- Injected ~1/3-1/2 in each testicle, used remained as dermal block at incision site.

Surgery

Clipped and prepped prescrotal area.

Made 3 cm ventral midline incision.

Exteriorized right testicle, placed 1 transfixing/encircling and 1 encircling ligature of 2-0 polydioxanone monofilament. Transected and crushed end of tissue. No bleeding seen

Repeated on Left.

Did final check for bleeding-none seen.

Closed fascia including median raphe with 1 cruciate of 2-0 polydioxanone monofilament.

Closed subcutaneous with 2-0 polydioxanone monofilament in a simple continuous pattern.

Closed subcuticular with 2-0 polydioxanone monofilament.

Applied skin glue.

Made 3 cm paramedian incision, applied green tattoo ink, closed with skin glue.

Placed microchip SQ between scapulas; scanned and verified number

Client Communication

11-06-2023 3:10:00pm

Dr. Kristin Foley

Please call if you have any questions or concerns

Please keep incision area clean and dry for the next 10 days, Call if any Bleeding persists

Please keep quiet and confined for 7-10 days

Please store medication away from heat and direct sunlight, complete all medication unless otherwise directed

Please have Ollie wear an E-Collar if he licks at his incision or whenever he is unattended.

Ollie may be tired and a little whiny tonight from anesthesia, this will wear off over the next 12 hours. He may also have a decreased appetite for the next day or so, but offer him a small amount of food tonight.

You can start Ollie's medication tonight if he is eating. If he does not eat, start it in the morning.

Please let us know if Ollie is not eating by Wednesday

Ollie may have some scrotal swelling because of his procedure today. This is normal for some dogs, but if you notice it you can try applying a cold pack to the area 2-3 times a day for 5-10 minutes at a time. (A bag of frozen peas or bag of crushed ice wrapped in a towel makes an excellent cold pack.)

Post-Operative Castration Instructions

Ollie has been castrated today, which involved surgery in a very sensitive area and therefore he needs care for sometime after the event. Unfortunately, dogs do not always understand that they must rest so we need you to assist in Ollie's recovery.

When you pick Ollie up from our hospital, he may be a little drowsy. This is quite normal following an anesthetic and surgery. The drowsiness should subside over the next 12 - 24 hours. Please keep him inside and warm tonight. There may be some bruising, just as in humans, so Ollie should not be expected to be completely normal for a few days.

Please keep him quiet and rested during this time including no running, jumping, or vigorous activity. Ollie's sutures will need to be kept dry, that means no swimming or bathing. It is very important that Ollie does not lick his stitches as this can introduce infection and also open the wound. Please monitor the incision for any signs of redness, swelling or discharge; and if any of these are identified please contact us immediately.

Please offer Ollie only small amounts of food and water tonight. From tomorrow morning, he can receive food and water as normal.

Generally, there are very few complications following this operation, however, there are some signs to watch out for that may indicate a problem. If you notice any of these signs please contact us immediately:

- Dull and listless especially (especially after the first 24 hours)
- Excessive redness or irritation around the suture line
- Swelling or lumpiness around the suture
- Discharge from the wound or reproductive organs
- Vomiting, diarrhea, inappetence or blood in the stool
- Chewing at sutures
- Broken sutures or odour from the wound
- Urinary incontinence (leaking of urine)
- No stools for more than 2 days after coming home

Please give the prescribed medication as directed and feed Ollie normally throughout this time.

If you have any questions or concerns regarding Ollie's progress, please do not hesitate to contact us.

Regards,

The Team at
